Outline

Constraint Programming preliminaries

The ATMOSTSEQCARD constraint

Filtering the domains

Experimental results

Conclusion & Future work

CSP

A constraint satisfaction problem (CSP) is a triplet $P = (\mathcal{X}, \mathcal{D}, \mathcal{C})$ where

- \mathcal{X} is a set of variables.
- \mathcal{D} is the related sets of values.
- \mathcal{C} is a set of constraints.

A solution of a CSP is an assignment w satisfying all the constraints.

CSP

A constraint satisfaction problem (CSP) is a triplet $P = (\mathcal{X}, \mathcal{D}, \mathcal{C})$ where

- \mathcal{X} is a set of variables.
- \mathcal{D} is the related sets of values.
- \mathcal{C} is a set of constraints.

A solution of a CSP is an assignment w satisfying all the constraints.

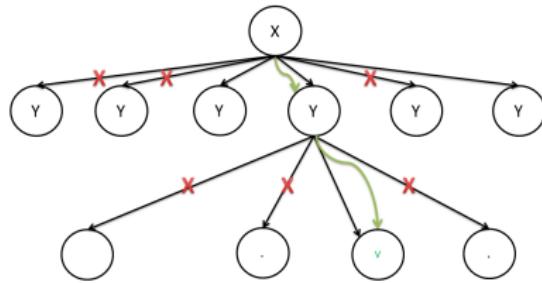

Example

- $X = \langle x, y \rangle$
- $D = \langle \{1, 2, 3, 4\}, \{3, 4, 7, 10\} \rangle$
- $C_1 = \{x \text{ is even}\}$
- $C_2 = \{x + y \leq 7\}$
- →A possible solution: $\langle x = 2, y = 4 \rangle$

Propagation

- A propagator (or filtering algorithm) aims to remove some values that are inconsistent.
- **Correctness & Checking**

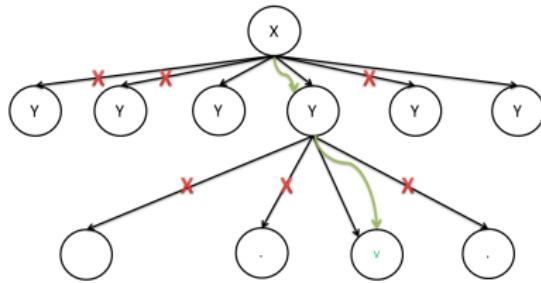

Figure: Propagation impact

Propagation

- A propagator (or filtering algorithm) aims to remove some values that are inconsistent.
- **Correctness & Checking**

Figure: Propagation impact

- An arc consistency algorithm is a complete filtering algorithm, i.e. when associated to a constraint C , it removes all the inconsistent values.

Global constraints

- A global constraint is constraint with unfixed arity ($n > 2$).
- For instance, the AllDifferent($x_1, x_2..x_n$) constraint ensures that the all variables, x_1 to x_n , have different values.
- More than 360 constraints in the literature (see the global constraint catalog
<http://www.emn.fr/z-info/sdemasse/gccat/>)
- A global constraint captures a sub-problem.
- A global constraint can be used to resolve different problems.
- A global constraint \leftrightarrow spatial propagator.

Propagation & Global Constraints

AllDifferent(X, Y, Z)

$$X, Y, Z, D_X = D_Y = D_Z = \{1, 2\}$$

| Decomposition | Global Constraint |
|---|--|
| $C_1 : X \neq Y; C_2 : Y \neq Z; C_3 : Z \neq X;$ | AllDifferent(X, Y, Z) |
| Propagate(C_1) : $C_1 : X \neq Y$ $D_X = D_Y \{1, 2\}$ → No propagation! | $D_X = D_Y = D_Z = \{1, 2\}$ → Failure! |
| Propagate(C_2), Propagate(C_3) : No propagation | |

Definition

$\text{ATMOSTSEQCARD}(u, q, d, [x_1, \dots, x_n]) \Leftrightarrow$

$$\bigwedge_{i=0}^{n-q} \left(\sum_{l=1}^q x_{i+l} \leq u \right) \wedge \left(\sum_{i=1}^n x_i = d \right)$$

Definition

$\text{ATMOSTSEQCARD}(u, q, d, [x_1, \dots, x_n]) \Leftrightarrow$

$$\bigwedge_{i=0}^{n-q} \left(\sum_{l=1}^q x_{i+l} \leq u \right) \wedge \left(\sum_{i=1}^n x_i = d \right)$$

Example $\text{ATMOSTSEQCARD}(2, 4, 4, [x_1, \dots, x_7])$

$$\begin{array}{ccccccc} 0 & 1 & \color{red}{1} & 0 & 1 & 1 & 0 \\ \hline \hline & \underline{\quad} & \underline{\quad} & \underline{\quad} & \underline{\quad} & \underline{\quad} & \underline{\quad} \\ & \color{red}{\underline{\quad}} & \color{red}{\underline{\quad}} & \color{red}{\underline{\quad}} & \color{red}{\underline{\quad}} & \color{red}{\underline{\quad}} & \color{red}{\underline{\quad}} \end{array}$$

$$\begin{array}{ccccccc} 1 & 1 & 0 & 0 & 1 & 0 & 1 \\ \hline \hline & \underline{\quad} & \underline{\quad} & \underline{\quad} & \underline{\quad} & \underline{\quad} & \underline{\quad} \\ & \underline{\quad} & \underline{\quad} & \underline{\quad} & \underline{\quad} & \underline{\quad} & \underline{\quad} \end{array}$$

Context

Sequence Constraints

- Let $[x_1, \dots, x_n]$ be a sequence of integer variables.

Context

Sequence Constraints

- Let $[x_1, \dots, x_n]$ be a sequence of integer variables.
- The AMONG constraint ensures that the number of occurrences of values in a given set of values $v = \{v_1..v_k\}$ in a subsequence $[x_{i_1}, \dots, x_{i_q}]$ is bounded between l and u .
e.g. $D(x_i) = \{0, \dots, 9\}$, $v = \{3, 6\}$, $l = 1$, $u = 2$,
 $Among([x_3, x_4, x_5, x_6], v, 1, 2)$:

[0,3,3,4] | [6,3,6,2]

Context

Sequence Constraints

- Let $[x_1, \dots, x_n]$ be a sequence of integer variables.
- The AMONG constraint ensures that the number of occurrences of values in a given set of values $v = \{v_1..v_k\}$ in a subsequence $[x_{i_1}, \dots, x_{i_q}]$ is bounded between l and u .
e.g. $D(x_i) = \{0, \dots, 9\}$, $v = \{3, 6\}$, $l = 1$, $u = 2$,
 $Among([x_3, x_4, x_5, x_6], v, l, u)$:

$$\overline{[0,3,3,4]} \mid [6,3,6,2]$$

- AMONGSEQ : the conjunction of all $n - q + 1$ AMONG on q consecutive variables (i.e. $\bigwedge_{i=0}^{n-q} AMONG([x_{i+1}, \dots, x_{i+q}])$).
e.g. $AmongSeq([x_1, x_2, x_3, x_4, x_5, x_6], 4, v, l, u) \Leftrightarrow$
 $Among([x_1, x_2, x_3, x_4], v, l, u) \wedge$
 $Among([x_2, x_3, x_4, x_5], v, l, u) \wedge$
 $Among([x_3, x_4, x_5, x_6], v, l, u)$.

Sequence Constraints[2]

- GEN-SEQUENCE: Conjunction of (consecutive) AMONG

Sequence Constraints[2]

- GEN-SEQUENCE: Conjunction of (consecutive) AMONG
- Global Sequencing Constraint: $\text{AMONGSEQ} \oplus \text{Global Cardinality Constraint}$

Sequence Constraints[2]

- GEN-SEQUENCE: Conjunction of (consecutive) AMONG
- Global Sequencing Constraint: AMONGSEQ \oplus Global Cardinality Constraint
- ATMOSTSEQCARD \equiv AMONGSEQ \oplus a cardinality constraint

Sequence Constraints[2]

- GEN-SEQUENCE: Conjunction of (consecutive) AMONG
- Global Sequencing Constraint: AMONGSEQ \oplus Global Cardinality Constraint
- $\text{ATMOSTSEQCARD} \equiv \text{AMONGSEQ} \oplus$ a cardinality constraint
- ATMOSTSEQCARD can be encoded with a GEN-SEQUENCE

Sequence Constraints[2]

- GEN-SEQUENCE: Conjunction of (consecutive) AMONG
 - Global Sequencing Constraint: AMONGSEQ \oplus Global Cardinality Constraint
 - $\text{ATMOSTSEQCARD} \equiv \text{AMONGSEQ} \oplus$ a cardinality constraint
- ATMOSTSEQCARD can be encoded with a GEN-SEQUENCE
- ATMOSTSEQCARD can be encoded with a Global Sequencing Constraint (Gsc)

Existing complexities

Gen-Sequence

- COST-REGULAR encoding: $O(2^q n)$ [Van Hoeve et al, 2009]
- Gen-Sequence: $O(n^3)$ [Van Hoeve et al, 2009]
- Flow-based Algorithm: $O(n^2)$ [Maher et al, 2008]

GSC

- GCC encoding, Not AC, NP-Hard [Puget and Régin, 1997]

Why the ATMostSEQCARD constraint? [1]

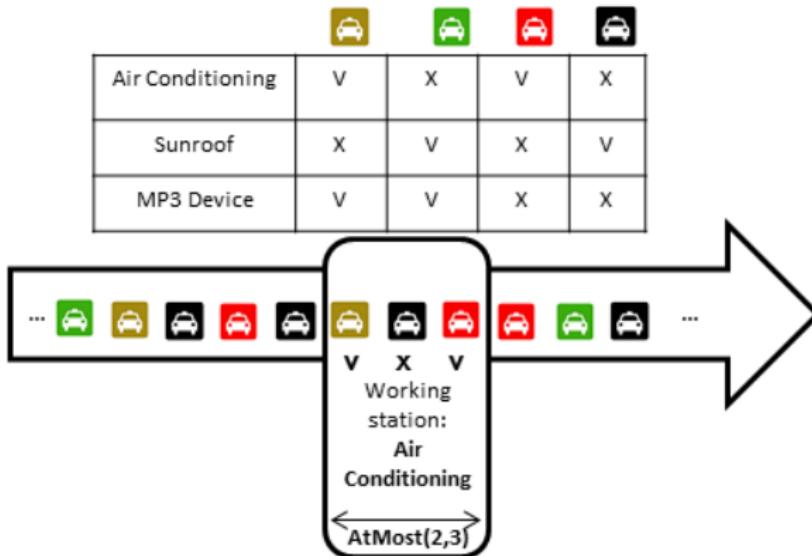

Figure: The car-sequencing problem

Why the ATMOSTSEQCARD constraint? [2]

7 days, 4 employees, 3 periods, 40h per week, Atmost(1,3)

| | D | E | N | D | E | N | D | E | N | D | E | N | d | | | | |
|------------------|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| emp ₁ | 0 | 1 | 0 | 0 | 0 | 1 | 0 | 0 | 0 | 1 | 0 | 0 | 1 | 0 | 0 | 5 | |
| emp ₂ | 1 | 0 | 0 | 1 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 1 | 0 | 0 | 5 |
| emp ₃ | 0 | 0 | 0 | 1 | 0 | 0 | 1 | 0 | 0 | 0 | 1 | 0 | 0 | 0 | 0 | 1 | 5 |
| emp ₄ | 0 | 1 | 0 | 0 | 0 | 1 | 0 | 0 | 1 | 0 | 0 | 0 | 1 | 0 | 0 | 0 | 5 |

Table: Crew-rostering problem

The proposed algorithm

- Let (x_1, \dots, x_n) be a boolean sequence subject to $\text{ATMOSTSEQCARD}(u, q, d, [x_1, \dots, x_n])$
- Suppose that $n = 50$, $d = 17$, and we have : $D\{x_i\} = \{0, 1\}$:

| | | | | | | |
|---|----|---------|-----------------------|---------|----|------------|
| 1 | .. | $i - 1$ | i | $i + 1$ | .. | n |
| 0 | .. | 1 | $D\{x_i\} = \{0, 1\}$ | 0 | .. | $\{0, 1\}$ |
- If $\text{Max1Left}_{i-1} = 7$, $\text{Max1Right}_{i+1} = 9$, \Rightarrow We have to force the variable x_i to have the value 1 in order to satisfy the cardinality.
- If $\text{Max0Left}_{i-1} = 10$, $\text{Max0Right}_{i+1} = 23$, \Rightarrow We have to force the variable x_i to have the value 0 in order to satisfy the occurrences of 0 (i.e. $n - d = 33$).

→ Complexity = $O(n.q)$

leftmost_count

- `leftmost_count([x_1, \dots, x_n], u, q, d)`: a linear time implementation of `leftmost` but returning the maximum cardinality that we can add to the sequence until i .

leftmost_count

- `leftmost_count([x1, ..., xn], u, q, d)`: a linear time implementation of `leftmost` but returning the maximum cardinality that we can add to the sequence until i .
- Example:

| | |
|--------------------------------|---|
| $\mathcal{D}(x_i)$ | . 0 0 1 0 1 |
| <code>leftmost[i]</code> | 1 0 1 1 1 0 0 0 0 1 0 1 1 1 0 0 0 1 0 1 1 1 |
| <code>leftmost_count[i]</code> | 0 1 1 2 3 4 4 4 4 4 4 4 5 6 7 7 7 7 8 8 9 10 10 |

leftmost_count

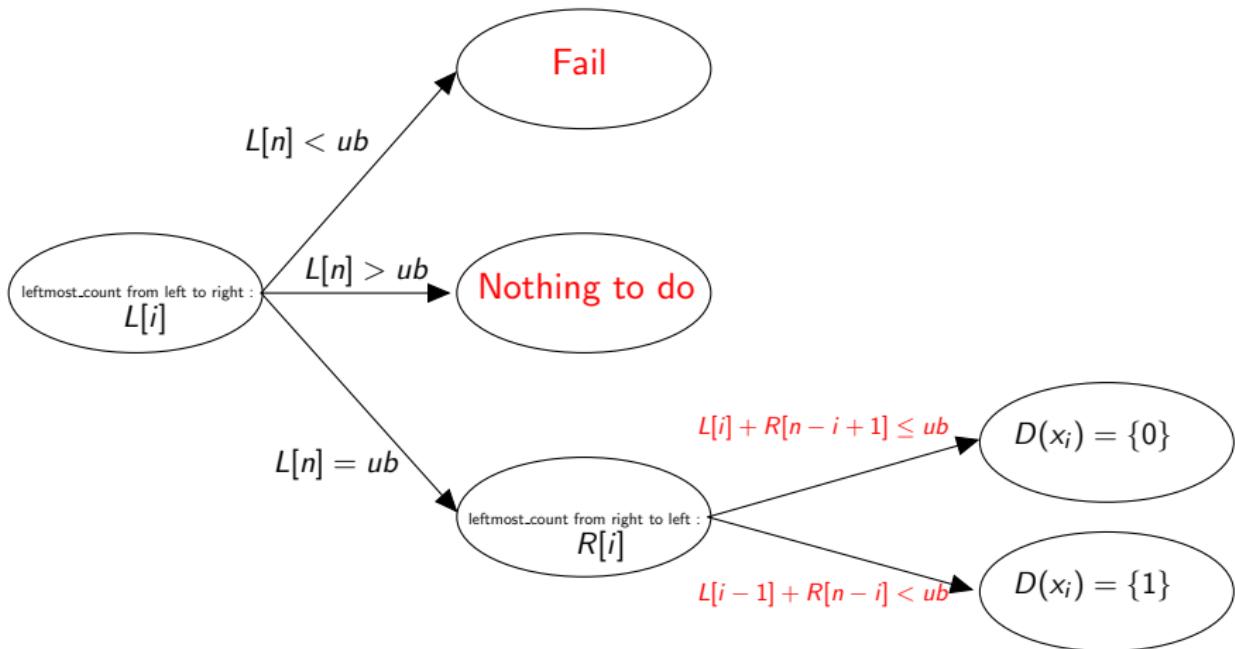

- $\text{leftmost_count}([x_1, \dots, x_n], u, q, d)$: a linear time implementation of `leftmost` but returning the maximum cardinality that we can add to the sequence until i .
- Example:

| | |
|--------------------------------|---|
| $\mathcal{D}(x_i)$ | . 0 0 1 0 1 |
| <code>leftmost[i]</code> | 1 0 1 1 1 0 0 0 0 1 0 1 1 1 0 0 0 1 0 1 1 1 |
| <code>leftmost_count[i]</code> | 0 1 1 2 3 4 4 4 4 4 4 4 5 6 7 7 7 7 8 8 9 10 10 |

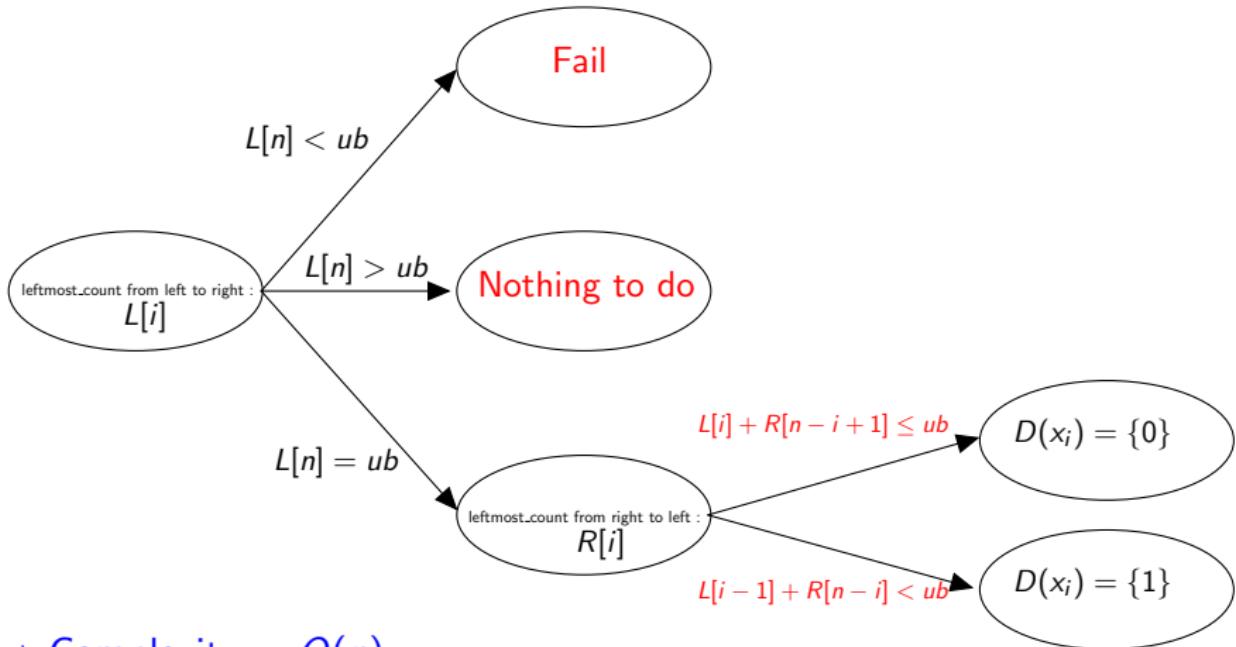

- L (resp. R): the result of `leftmost_count` from left to right (resp. right to left).

Car-sequencing

Constraints

- Each class c is associated with a demand D_c .
- For each option j , each sub-sequence of size q_j must contain at most u_j cars requiring the option j .

Models

- ① sum
- ② gsc
- ③ amsc
- ④ amcs + gsc

Heuristics

$\langle \{lex, mid\}, \{class, opt\}, \{1, q/u, d, \delta, n - \sigma, \rho\}, \{\leq_{\Sigma}, \leq_{Euc}, \leq_{lex}\} \rangle$.
→ 34 heuristics x 5 randomized tests.

Benchmarks (CSP Lib)

- Groupe 1: 70 satisfiable instances
- Groupe 2: 4 satisfiable instances
- Groupe 3: 5 unsatisfiable instances
- Groupe 4: 7 satisfiable instances

Experimental results

Table: Experimental results : Car-sequencing

| Models | G1 ($70 \times 34 \times 5$) 11900 | | G2 ($4 \times 34 \times 5$) 680 | | G3 ($5 \times 34 \times 5$) 850 | | G4 ($7 \times 34 \times 5$) 1190 | |

| amsc+gsc | 11243 | 3.43 | 339 | 106.53 | 32 | 285.43 | 147 | 66.45 |

- The level of filtering obtained by enforcing AC on the ATMOSTSEQCARD constraint is incomparable with that of the GCC encoding of the GSC constraint
- The GSC propagator seems to save more backtracks than ATMOSTSEQCARD.

Experimental results

Table: Experimental results : Car-sequencing

| Models | G1 ($70 \times 34 \times 5$) 11900 | | G2 ($4 \times 34 \times 5$) 680 | | G3 ($5 \times 34 \times 5$) 850 | | G4 ($7 \times 34 \times 5$) 1190 | |
|----------|---|-------------|--------------------------------------|--------|--------------------------------------|---------------|---------------------------------------|-------|
| | #sol | time | #sol | time | #sol | time | #sol | time |
| sum | 8480 | 13.93 | 95 | 76.60 | 0 | > 1200 | 64 | 43.81 |
| gsc | 11218 | 3.60 | 325 | 110.99 | 31 | 276.06 | 140 | 56.61 |
| amsc | 10702 | 4.43 | 360 | 72.00 | 16 | 8.62 | 153 | 33.56 |
| amsc+gsc | 11243 | 3.43 | 339 | 106.53 | 32 | 285.43 | 147 | 66.45 |

- The level of filtering obtained by enforcing AC on the ATMOSTSEQCARD constraint is incomparable with that of the GCC encoding of the GSC constraint
- The GSC propagator seems to save more backtracks than ATMOSTSEQCARD.
- However, it's much slower than ATMOSTSEQCARD (overall a factor of **12.5** on the number of nodes explored per second!)

Crew-rostering

| | Week 1 | | | | | | | W 2 | W 3 | W 4 | d |
|-------------------|--------|-------|-------|-------|-------|-------|-------|-----|-----|-----|-------|
| emp ₁ | --- | --- | --- | --- | --- | --- | --- | | | | 17 |
| emp ₂ | --- | --- | --- | --- | --- | --- | --- | .. | .. | .. | 17 |
| .. | --- | --- | --- | --- | --- | --- | --- | .. | .. | .. | 17 |
| emp ₂₀ | --- | --- | --- | --- | --- | --- | --- | .. | .. | .. | 17 |
| demande: | 6;6;3 | 6;6;3 | 6;6;3 | 6;6;3 | 6;6;3 | 2;2;1 | 2;2;1 | .. | .. | .. | 17*20 |

Constraints

- A required demand for each period.
- Each employee has to work 34 hours per week (17 shifts overall).
- Atmost 8h working shift per day.
- Atmost 5 days per week.

Models

- *sum*
- *gsc*
- *amsc*

Heuristics

- *worst employee*: $\text{MIN}(\sigma_i = n_i - \frac{21d_i}{5})$, $\text{MIN}(\sigma'_j = m_j - d_j^s)$.
- *worst shift*: $\text{MIN}(\sigma'_j = m_j - d_j^s)$, $\text{MIN}(\sigma_i = n_i - \frac{21d_i}{5})$

Benchmarks

- 281 instances with different employee unavailabilities (ranging from 18% to 46% by increment of 0.1).
- Set 1: 126 sat instances.
- Set 2: 111 instances (mostly sat).
- Set 3: 44 instances (mostly unsat).

Experimental results

Table: Experimental results: Crew-Rostering

| Benchmarks | G1 ($5 \times 2 \times 126$) 1260 | | G2 ($5 \times 2 \times 111$) 1110 | | G3 ($5 \times 2 \times 44$) 440 | |
|------------|--|-------------|--|--------------|--------------------------------------|-------------|
| | #sol | time | #sol | time | #sol | time |
| sum | 1229 | 12.72 | 574 | 38.45 | 272 | 5.56 |
| gsc | 1210 | 29.19 | 579 | 77.78 | 276 | 24.14 |
| amsc | 1237 | 5.82 | 670 | 31.01 | 284 | 6.22 |

Experimental results

Table: Experimental results: Crew-Rostering

| Benchmarks | G1 ($5 \times 2 \times 126$) 1260 | | G2 ($5 \times 2 \times 111$) 1110 | | G3 ($5 \times 2 \times 44$) 440 | |
|------------|--|-------------|--|--------------|--------------------------------------|-------------|
| | #sol | time | #sol | time | #sol | time |
| sum | 1229 | 12.72 | 574 | 38.45 | 272 | 5.56 |
| gsc | 1210 | 29.19 | 579 | 77.78 | 276 | 24.14 |
| amsc | 1237 | 5.82 | 670 | 31.01 | 284 | 6.22 |

- By analogy with the car-sequencing, there is one class with one option for each employee since we treat boolean variables.

Experimental results

Table: Experimental results: Crew-Rostering

| Benchmarks | G1 ($5 \times 2 \times 126$) 1260 | | G2 ($5 \times 2 \times 111$) 1110 | | G3 ($5 \times 2 \times 44$) 440 | |
|------------|--|-------|--|-------|--------------------------------------|-------|
| | #sol | time | #sol | time | #sol | time |
| sum | 1229 | 12.72 | 574 | 38.45 | 272 | 5.56 |
| gsc | 1210 | 29.19 | 579 | 77.78 | 276 | 24.14 |
| amsc | 1237 | 5.82 | 670 | 31.01 | 284 | 6.22 |

- By analogy with the car-sequencing, there is one class with one option for each employee since we treat boolean variables.
- The GSC constraint here is equivalent to the ATMOSTSEQCARD hence can not do better than our propagator.

Experimental results

Table: Experimental results: Crew-Rostering

| Benchmarks | G1 ($5 \times 2 \times 126$) 1260 | | G2 ($5 \times 2 \times 111$) 1110 | | G3 ($5 \times 2 \times 44$) 440 | |
|------------|--|-------------|--|--------------|--------------------------------------|-------------|
| | #sol | time | #sol | time | #sol | time |
| sum | 1229 | 12.72 | 574 | 38.45 | 272 | 5.56 |
| gsc | 1210 | 29.19 | 579 | 77.78 | 276 | 24.14 |
| amsc | 1237 | 5.82 | 670 | 31.01 | 284 | 6.22 |

- By analogy with the car-sequencing, there is one class with one option for each employee since we treat boolean variables.
- The GSC constraint here is equivalent to the ATMOSTSEQCARD hence can not do better than our propagator.
- ATMOSTSEQCARD is much faster than the GSC : a factor **20.4** in terms of explored nodes per second!

Contributions

- Best existing complexity: $O(n^2)$ [Maher et al, 2008].
- A complete filtering algorithm with a linear time complexity $O(n)$.
 - Car-sequencing
 - Crew-Rostering

Future work

- Adapt the filtering rule with more general sequence constraints.
- Building a Propagator-based nogood generator for the ATMOSTSEQCARD algorithm in a Pseudo-Boolean Solver.

Thank you!
